

Storage Elements Behave the Same

From OpenDSSWiki

Question

I have two Storage devices and two StorageControllers, but both Storage devices act as if they are controlled by the same StorageController. What is happening?

Answer

By default, a StorageController will grab all Storage devices in the problem. If you want it to control just one, or a few, Storage elements, use the ElementList property to specify the name(s) of the Storage-class elements that you want it to control.

This is an array element. You can specify with the usual syntax:

```
~ ElementList=[name1, name2, name3, ...]  
~ ElementList=[file=MyListOfNames.txt] ! one name to a line in the file
```

Note: As of Oct 25, 2010, the latest version of the StorageController will only grab a Storage element if no other Controller has it in its list. An error message is issued if there are no Storage elements found.
